What is Drupal Behaviors?

Drupal Behaviors is the object in JavaScript that Drupal initializes after page load, and after every **AJAX call in DOM** (Document Object Model).

Behaviors allow us to perform better and easier integration of JavaScript in Drupal projects, forcing developers to follow the coding standards.

Here is an example:

```
Drupal.behaviors.exampleModule = {  
  attach: function (context, settings) {  
    $('.example', context).click(function () {  
      $(this).next('ul').toggle('show');  
    });  
  }  
};
```

To change jquery version in drupal 8
